As financial institutions move their operations, including core functions, to the cloud, financial regulators have begun to issue regulations and informal guidance addressing the use of cloud services in the financial sector. These are typically based on the regulator's existing framework for outsourcing by a financial institution to third-party technology providers, under which the risks associated with outsourcing and the supervision of third-party providers are primarily the responsibility of the financial institution. This report provides background on the use of cloud computing in the financial sector, reviews existing regulatory and supervisory frameworks for cloud use by financial institutions, and recommends improvements to those frameworks that could reduce obstacles to

This book introduces machine learning in finance and illustrates how we can use computational tools in numerical finance in real-world context. These computational techniques are particularly useful in financial risk management, corporate bankruptcy prediction, stock price prediction, and portfolio management. The book also offers practical and managerial implications of financial and managerial decision support systems and how these systems capture vast amount of financial data. Business risk and uncertainty are two of the toughest challenges in the financial industry. This book will be a useful guide to the use of machine learning in forecasting, modeling, trading, risk management, economics, credit risk, and portfolio management.

This paper explores the extent to which public cloud computing is in fact being used in practice by banks operating in the EU, including global banks. It is based primarily on anonymised interviews with banks, cloud providers, advisers, and financial services regulators. This paper describes how banks are using cloud computing and their key drivers (such as time to market), as well as real and perceived barriers (such as misconceptions about cloud, and financial services regulation), including cultural and technical/commercial as well as legal/regulatory aspects. It summarises how banks and regulators have approached the cloud, as well as how cloud providers have approached the banking sector. Specific consideration is given to barriers arising from

banking regulatory rules on outsourcing, critical or material, and the contentious issue of contractual audit rights for regulators. The paper also analyses legal and practical issues such as risk assessments, security, business continuity including exit plans, concentration risk and bank resolution, continuing regulatory oversight, banking secrecy laws, barriers under data protection law including personal data export restrictions, problems arising from layered service models where SaaS services are built on another provider's IaaS/PaaS service, and commonly-negotiated contractual provisions regarding termination, service changes and liability. The paper concludes that, while some barriers are internal and some external, cloud is still misunderstood, and further educational efforts are needed to ensure regulatory approaches and guidance are sufficiently cloud-aware to strike the appropriate balance between risk management and efficiency/innovation across the European Economic Area.

DIVE INTO THE GREAT WIDE OPEN Young. Hungry. Visionary. Chris Zadeh saw a future few could ever imagine possible. When he presented his idea--coding a new core banking engine in the cloud--bankers laughed. They scoffed. Then they rejected his revolutionary idea outright. They said, "The cloud's not safe." "Who do you think you are--telling us how to run our banks?" "And who the hell is ever going to put a bank on the cloud?" Chris Zadeh and his team of underdogs knew the answer: everyone. They also knew the cloud wasn't just safe, it was the future of banking. And more than anything, he knew exactly who he and his team were: they were Ohpen, the first software company in the world to put a bank on the cloud. Together, this band of brothers harnessed their give-it-all mentality, fighting spirit, and bold vision to change how the world banks. In this surprising, unfiltered, outstandingly told story, *Banking the Cloud* takes the reader on an epic journey--from thrill of discovery, to the devastation of defeat, and to an exhilarating and last-minute rally that changed everything. is a remarkable tale of what it takes to innovate, survive, and ultimately win no matter what the obstacle. You'll find it impossible to put this book down.

This open access Pivot demonstrates how a variety of technologies act as innovation catalysts within the banking and financial services sector. Traditional banks and financial services are under increasing competition from global IT companies such as Google, Apple, Amazon and PayPal whilst facing pressure from investors to reduce costs, increase agility and improve customer retention. Technologies such as blockchain, cloud computing, mobile technologies, big data analytics and social media therefore have perhaps more potential in this industry and area of business than any other. This book defines a fintech ecosystem for the 21st century, providing a state-of-the art review of current literature, suggesting avenues for new research and offering perspectives from business, technology and industry.

This extraordinary book, written by leading players in a burgeoning technology revolution, is about the merger of finance and technology (fintech), and covers its various aspects and how they impact each discipline within the financial services industry. It is an honest and direct analysis of where each segment of financial services will stand. Fintech: The New DNA of Financial Services provides an in-depth introduction to understanding the various areas of fintech and terminology such as AI, big data, robo-advisory, blockchain, cryptocurrency, InsurTech, cloud computing, crowdfunding and many more. Contributions from fintech innovators discuss banking, insurance and investment management applications, as well as the legal and human resource implications of fintech in the future.

Cloud computing is gradually being adopted within the European financial industry. However, the adoption approach is not yet mature. The vast majority of Financial Institutions (FIs) still rely on

in-house infrastructure. Finance sector Institutions and supervisory authorities seem to have a clear view of the financial and technical benefits connected to the adoption of both Public and Private Cloud deployment models, but they remain cautious about the risk of losing control over information assets. The most common approach used by FIs is a Hybrid of Private and Public Cloud. Even then, the services most often migrated to the cloud are test environments and email management. Financial Institutions consider that Private Cloud is a better overall fit for the financial market due to privacy and compliance concerns. Private Cloud is certainly favoured by the National Financial Supervisory Authorities (NFSAs), as it provides more control over data and operations. In creating this report we analysed input from a number of different sources to better understand the usage of cloud services in the finance sector. Based on the analysis we provide recommendations to financial institutions, regulators and cloud service providers about what we believe should be done to support secure adoption of cloud services in the finance sector.
