The fourth edition of *Clinical Medicine of the Dog and Cat* remains the most extensively illustrated and practical small animal veterinary textbook on the market. It continues and expands on the revolutionary problem-based approach of the previous three editions, with more than 1,100 clinical color photographs, diagrams, and tables. The book is divided into five color-coded sections—General Approach, Diagnostic Techniques, Disease of Specific Organ Systems, Multisystemic Disorders, and Elements of Therapy. For this edition: Case studies are integrated within the relevant chapters for ease of reference. The first section on common medical problems now includes abdominal distension, peripheral edema, proteinuria, regurgitation, and seizures. Chapters on thoracic and abdominal radiographs are now included in a unique new section on Diagnostic Techniques, encouraging an integrated learning approach. The third section contains detailed medical information covering most organ systems, with several chapters completely rewritten and others comprehensively updated to include additional text and images. Additional endoscopic, radiographic, CT, and MRI images are included alongside clinical photographs; very few veterinary textbooks have such a rich emphasis on photographs. Each section has a limited number of recommended updated references. The practical information is presented with text, tables, and algorithms, while each chapter is arranged to provide the definition of each disorder, its clinical features, the differential diagnoses, the diagnostic methodology, and the treatment and prognosis. The formatting has been improved to make this textbook easy to read and comprehend. The busy veterinarian or student is thus

Pain Management in Small Animal Medicine describes and clearly illustrates the difficulties and choices facing veterinarians in identifying and treating pain, in addition to providing an account of the neurobiological mechanisms responsible for the pain. Expanded from the author's previous work, *Chronic Pain in Small Animal Medicine*, this volume uses the original text to illustrate the core theme of "mechanism base" and expands the text considerably with the inclusion of areas beyond chronic pain. Topics include:

Pain assessment in small animal medicine
The functional physiology of pain
The use of pharmacologics and nonsteroidal anti-inflammatory drugs
Nutraceutical mechanisms and therapy
Management of pain related to canine osteoarthritis, musculoskeletal disease, and cancer
Pain management features unique to cats
Emphasizing the latest evidence and contemporary understanding of "why" and "how" to treat pain, the book will enable veterinary healthcare professionals as well as those in training, education, and research to develop a greater depth of knowledge in mechanisms of pain and potential targets for treatment— thereby raising the standard of care for pain management.

This book deals with pain in companion animals and how it affects their welfare, health and, of course, behaviour. It describes the difficulties encountered, throughout history, to finally reach the conclusion that animals and humans share the same neurophysiological mechanisms to feel pain, and what their sensitive pathways are. It then goes deeper into the changes that pain can cause in the behaviour of dogs and cats and the tools available to the veterinary surgeon to control it. Good veterinary practice and professional ethics lead us to try to reduce pain in animals as much as possible. Having a book such as this one can help us achieve this objective.
