The laws of physics are expressed as mathematical relationships among physical quantities. Most of these quantities are derived quantities, or they can be expressed as combination of some basic quantities. There are mainly three quantities in physics or mechanics, Length , Mass and Time. To do calculations and analysis in physics a standard is established for each of these three quantities.

Standards of Measurement:
Length , Mass and Time.

Any mechanical quantity can be expressed in terms of three fundamental quantities, mass,

length and time. For example, speed is a length divided by time. Force is mass times acceleration, and is therefore a mass times a distance divided by the square of a time. We therefore say that $[\text{Force}] = \text{MLT}^{-2}$. The square brackets mean: "The dimensions of the quantity within". The equations indicate how force depends on mass, length and time.

Measurement of Length, Mass and Time: Parallax, Videos and ... Length, Mass and Time . The current system of units has three standard units: the meter, kilogram, and second. These three units form the mks-system or the metric system. A meter is a unit of length, currently defined as the distance that light travels in $1/299,792,458$ of a second. A kilogram is a unit of mass. While it was previously defined as a specific volume of water (i.e. 1 liter or a 10 cm^3 cube), its current definition is based on a prototype platinum-iridium cylinder.

The SI units of length, mass and time, meter, kilogram and seconds are commonly used across various branches of science. In addition to these, the US customary systems are also used. It measures, the length, mass, and time in terms of foot, slug, and seconds. The CGS or Gaussian system measures these in cm, grams, and seconds.

Natural units - Wikipedia

The SI base units are the standard units of measurement defined by the International System of Units for the seven base quantities of what is now known as the International System of Quantities: they are notably a basic set from which all other SI units can be derived. The units and their physical quantities are the second for time, the metre for measurement of length, the kilogram for mass, the ampere for electric current, the kelvin for temperature, the mole for amount of substance, and the ca

Length per Time per Time or $\mathrm{L/T^2}$ respectively.
Hence the dimension of force is just the product of these
$$[F] = [ma] = [m][a] = \mathrm{M} \cdot \mathrm{L/T^2}$$
 which translates to the unit of force $\mathrm{kg \cdot m / s^2}$ AKA 1 Newton or $1\mathrm{N}$ in SI-units.

How is it that Force = Mass \times Length / Time 2 ?
The increase in relativistic "effective mass" is associated with speed of light c the speed limit of the universe. This increased effective mass is evident in cyclotrons and other accelerators where the speed approaches c . Exploring the

□ Three basic quantities of mechanics are length, mass, and time, which in the SI system have the units meters (m), kilograms (kg), and seconds (s), respectively

□ Prefixes are used along with the three basic units □ indicate various powers of ten

□ The density of a substance is defined as its mass per unit volume

□ Dimensional analysis is very powerful in solving/checking physics problems.

BACKGROUND Whilst the choice of units in most problems is arbitrary, and therefore might seem largely irrelevant, it is important to note that independence of physics on units is actually highly significant and leads to the concept of scale invariance and the powerful tool of dimensional analysis.
